

# Ability Drive®

Tolt Technologies Ability Drive® is an alternative control interface that enables you to control a powered wheelchair with your eyes. Using virtual buttons and eye gaze technology, people who are not able to use a joystick can regain movement and seat positioning independence.

## How it works

Tolt Technologies Ability Drive® is a combination of hardware and an app. The Ability Drive® app runs on an approved eye gaze device. The app senses your gaze on virtual buttons which send directional movement commands to the Ability Drive® hardware interface. These buttons overlay the forward camera view. Looking at the stop button, looking away from the computer, or closing your eyes stops wheelchair movement.
